

Instructions for use

Pre&Post Clean

The light, non-flammable cleaning agent removes dust, fingerprints and light oil soiling from stainless steel surfaces or glass quickly, safely and streak-free. It is suitable for degreasing BEFORE welding; we recommend using it AFTER every cleaning measure: Pre&Post Cleaner neutralises the surface and thus prevents the formation of white stains.

- Please refer to the relevant safety data sheets before use.
- The Pre&Post Cleaner is an ethanol-based cleaner that does not require labelling.
- The PRE&POST Cleaner has been specially developed for cleaning workpieces prior to welding and for neutralisation following electrochemical cleaning and pickling processes. Before welding, it reliably removes grease, oil, light soiling and other contaminants from the surface. After cleaning with REUTER products, it ensures the safe neutralisation of any remaining residues, thereby supporting the corrosion protection of the workpiece.
- Apply the PRE&POST Cleaner to the surface to be treated and spread it evenly. You can use the spray bottle or the wipes from the M or XL wipe dispenser for this. Then wipe the surface thoroughly dry with a clean white paper towel. Ensure that no product residue remains on the surface and that the workpiece is completely dry.
